Installation

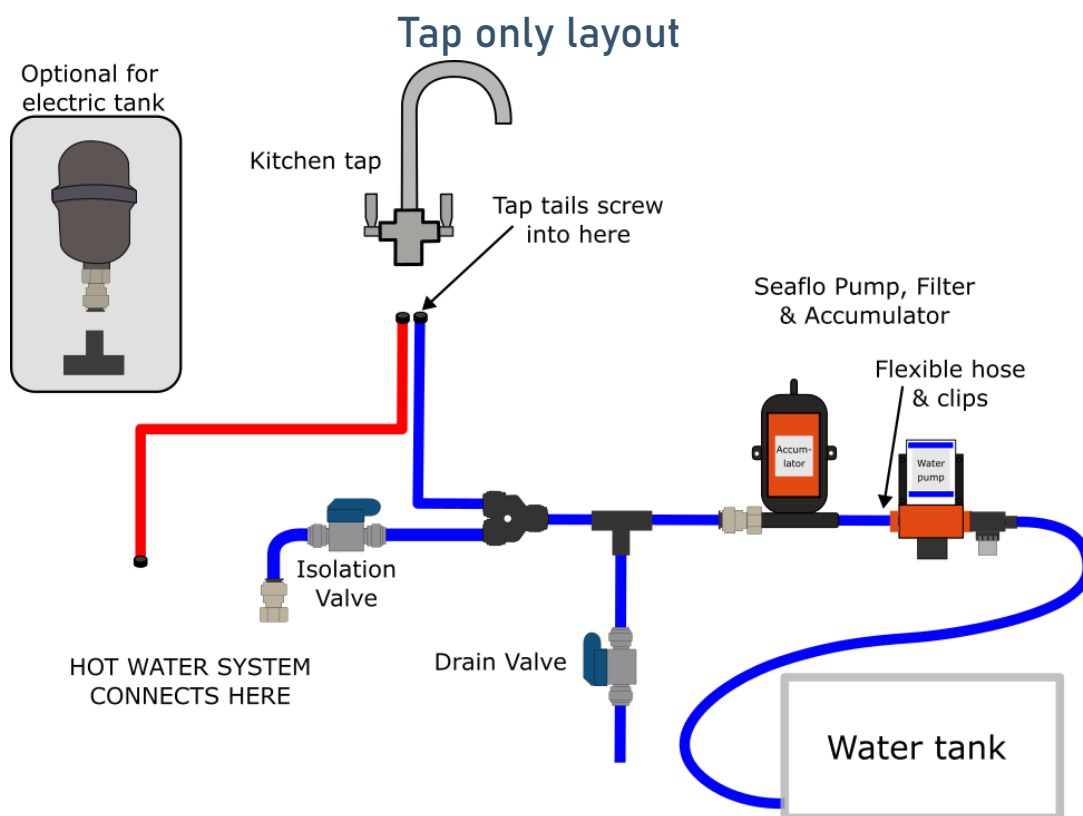

John Guest 12mm pushfit pipe is a simple system - cut the pipe to length, and push into place. John Guest pipe is flexible as well, to a degree, and we recommend using this flexibility, rather than adding additional restrictions like elbow's unless necessary.

- Ensure pipes are cut square, without any burrs, and pushed firmly in.
- If you need to demount the pipe, push the collar in and pull the pipe out.
- Push the pipe inserts into the end of each hot pipe.
- If you ordered the expansion tank addon, this T's into the hot line.
- The accumulator tank is set at 10psi. Normally, this is ok however you can reduce the pressure if the flow is still not smooth. 3psi above the pump start-up pressure is recommended (which is normally around 65% of the shut off pressure printed on the pump), but it is definitely not an exact science, so trial and error is encouraged.

Shower and tap layout

To see how to use the shower mixer easy fit kits, please watch this video. The 12mm reducer will push into the 15mm elbow which you can fit on the back of your easy fix kit. To fit the mixer with the pipe inserts, you may need to push the pipe through the olive before tightening the olive.

We would love to know what you think!

Please let us know by leaving a review through the link sent through when you made your purchase, or email us at info@bobilvans.co.uk!

You can also share photos of your installation on the 'Bobil Water Heater Users', Facebook page, we'd love to see them!
